## Tire Pressure Monitoring System - Auto-location

The Toyota Tire Pressure Monitoring System (TPMS) is designed to alert drivers when the tire pressure in one or more tires drops below the recommended level. The system utilizes sensors located in each tire that continuously monitor the air pressure. These sensors transmit real-time data to the TPMS control module. The control module then processes the data and compares it to the recommended tire pressure values. If the system detects low tire pressure, it triggers a warning light on the instrument panel.

To ensure accurate readings, the TPMS sensors must be periodically calibrated and maintained. This typically involves initializing the system after tire rotation or replacement.
